

Lithium battery parallel line

Overview

Battery packs are designed by connecting multiple cells in series; each cell adds its voltage to the battery's terminal voltage. Figure 1 below shows a typical BSLBATT 13.2V LiFePO₄ starter battery cell configuration. Parallel Connection connects multiple batteries in parallel; each battery adds its battery capacity to the ports. Batteries may consist of a combination of series and parallel connections. Cells in parallel increased current handling; each cell adds to the ampere. BSLBATT's 13.2V batteries may be used in series and or parallel to achieve higher operating voltages and or capacities for your specific application. It is important to use the same battery model with equal voltage and capacity (Ah).

Why is 8 the maximum number of lithium batteries in Parallel?

The BMS would have to fail in a way as to not take the battery off-line. A cell going over or under volt would take that battery off-line. Hopefully the BMS is designed to go off-line when it fails. But, if it doesn't, then it will cause problems for all the batteries (hence the need for the class T fuse).

2 identical batteries in parallel, but unequal discharge?

MY own personal rule is two batteries, 150% current of one battery. So with two batteries each capable of 100 amps, with 2 in parallel, you can pull 150 amps, so even if there is a 50 amp difference, the high battery is only at 100 amps, and the low one is providing the other 50 amps. Go to 4 batteries, and now you should be safe pushing 225%.
