

Losses of energy storage peak load regulation

Overview

The development and utilization of new energy is one of the biggest issues facing mankind. With the rapid development of new energy, its proportion in the power system is getting higher and higher, which will inevitably. In recent years, the development trend of China's new energy more and more quickly. PSS/E is a power system simulation software developed by Siemens Power Technologies International (PTI), whose main functions include power flow calculation, short circuit calculation, dynamic simulation, and parameter optimization. In this paper, a simple single-machine power system is used as an example for simulation verification. The system base capacity is 100 kVA, generated by a generator. In this paper, through a user-defined function in PSS/E, a generator, excitation model, and storage model are established for simulation, setting up a simple standalone power system simulation. The authors declare that they have no known competing financial interests or personal relationships that could have appeared to influence the work reported in this paper.
