

The role of battery ions

Overview

A battery is made up of several individual cells that are connected to one another. Each cell contains three main parts: a positive electrode (a cathode), a negative electrode (an anode) and a liquid electrolyte. Just like. Inside a lithium-ion battery, oxidation-reduction (Redox) reactions take place. Reduction takes place at the cathode. There, cobalt oxide combines with lithium ions to form lithium-cobalt oxide (LiCoO_2). The half-reaction is: When the lithium-ion battery in your mobile phone is powering it, positively charged lithium ions (Li^+) move from the negative anode to the positive.
