

The structure of lead-acid battery and lithium battery

Overview

At the anode: $\text{Pb} + \text{SO}_4^{2-} \rightarrow \text{PbSO}_4 + 2\text{e}^-$, The anode will be covered with a layer of PbSO_4 , $E = 0.36 \text{ V}$, The standard oxidation potential of this reaction = 0.36 Volt. At the cathode: $\text{PbO}_2 + 4\text{H}^+ + \text{SO}_4^{2-} + 2\text{e}^- \rightarrow \text{PbSO}_4 + 2\text{H}_2\text{O}$, The cathode will be covered with a layer of PbSO_4 , $E = 1.69 \text{ V}$, The standard reduction. The state of the battery can be identified by measuring the density of the acid by using a hydrometer (measuring liquid density), When the battery is completely charged, the density of acid = 1.28: 1.30 gm/cm^3 , When the density of the acid is decreased to lower than. Using the battery for a long period leads to a decrease the concentration of sulphuric acid as a result of increasing the quantity of water produced from the reaction and also leads to the conversion of cathode material (PbO_2) and anode (Pb) to lead (II) sulphate which lead to. Lithium battery is a secondary cell, It is a dry and rechargeable battery used in mobiles, laptop, the modern cars instead of the lead acid battery, it is lighter and stores a large amount of.
